

MARKET RESEARCH

Meta Ad Library ≠ copying hooks.

How strategists actually use it.

Most people do this wrong

They screenshot a winning hook.

They use it verbatim.

They wonder why it doesn't convert for their audience.

The 5-step scan

1. Active ads filter
2. Spend signals
3. Creative variants
4. Angle extraction
5. Pattern library

Step 1: Active ads filter

Filter by 'Last 90 days.' Sort by start date, descending.

What's running NOW is what's working NOW.

Step 2: Spend signals

An ad running for 30+ days across multiple regions is scaling.

Prioritize those. Ignore ads that ran for 3 days and died.

Step 3: Creative variants

A brand running 4 versions of the same ad is testing hooks.

The ad still running after 3 weeks is the winner.

Step 4: Angle extraction

What's the underlying claim?

Not 'this hook is fire' — what's the argument?

Hooks are disposable. Angles are reusable.

Step 5: Pattern library

Group by angle type: identity, problem, mechanism, outcome, proof.

Build a swipe file by category, not by creator.

What to note from every winner

- Hook angle
- Mechanism promise
- Proof element
- CTA style
- Emotional frame

Steal the system.

Not the copy.
