

CASE STUDY

\$784K from one email campaign.

Here's what actually worked.

The context

Black Friday. Mid-size DTC brand. Existing list: 140K subscribers.

Goal: maximize existing list revenue in a 10-day window.

What didn't work (tried first)

- Discount-first subject lines
- Same-time-every-day sends
- Generic 'BFCM' creative across all segments

The shift

Segment by behavior first, promotion second.

3 behavioral segments got 3 completely different campaigns.

Segment 1: Recent residents

Last-90-day active buyers.

**Got a 'thank you for being a regular' angle,
priority access 24h before public launch.**

Segment 2: Latent residents

Bought 6–18 months ago, haven't come back.

Got a 'we built this for you' angle with a specific product recommendation.

Segment 3: Tourists

Never bought but engaged with emails.

Got the broadest discount + 4-touch sequence.

The cadence trick

Each segment got 6 emails over 10 days.

But the send times were different per segment based on their historical open windows.

The result

\$784K attributed to the campaign.

Segment 1 drove 52% of revenue at 18% of the send volume.

Behavior beats promotion.

Segment before you send.

It's the difference between \$200K and \$784K.
