

PASSION.IO CASE STUDY

How we ran a record Black Friday for a Passion.io client. [verify with Muddassir]

Same list, different letters, different times.

THE STARTING POINT

Everyone on the list was getting the same email at the same time.

Open rates looked fine, and revenue stayed flat.

The list was being broadcast to, not written to.

01

THREE GROUPS, NOT ONE

1

Group A had bought in the last three months.

2

Group B had bought six to eighteen months ago.

3

Group C had never bought but still opened emails.

4

5

GROUP A. THE RECENT BUYERS

We sent a thank-you email, twenty-four hours before anyone else in the list saw the offer.

It read as a reward for already being a customer, and it did not read as a promotion.

Revenue from this group doubled first.

GROUP B. THE QUIET BUYERS

We wrote them about a specific new product that matched something they had bought before.

One clear line, one clear link, and no "we miss you" in the message at all.

GROUP C. THE NEVER-BUYERS

The cleanest offer in the whole sequence, sent as four emails across the window with rising urgency.

Accept that some of this group will never buy, and write for the ones who will.

DIFFERENT GROUPS, DIFFERENT SEND TIMES

We matched the send time to when each group had been opening in the past.

The data was already there, and we simply read it.

WHAT MOVED

Revenue per lead nearly doubled over the window. [verify with Muddassir]

Most of the lift came from Group A, which had the smallest send volume.

THE LESSON

You do not need a bigger list.

You need to actually read the one you already have.
